

RxBLU Enhancements Build 3.0.5

Dispill Interface

We are now working with Dispill to provide unit packaging options in Rxblu. Please call an RxBLU representative to learn more about Dispill and its integration into RxBLU.

Biometrics (Finger reading)

RxBLU now has the capability to use biometrics as a method of gaining access to all RxBLU products rather than the existing user names and passwords. Very affordable specific hardware is required for this feature. With this option, future enhancements will be made available to perform certain tasks in

Non-Equivalent Drug Detection

You may have encountered occasions where the program has detected a drug to be non-equivalent on refills. We are now allowing this to occur in specific cases. Rather than preventing the refill from being processed, a question alerting the user and asking for confirmation will occur. When proceeding through this alert, an audit entry for that Rx is created for that prescription.

Electronic Prescription Notes and Comments

Additional notes have been added to the displayed eScript. These notes may include insurance information and associated prescriber notes.

NOTES FROM PRESCRIBER:
please dispense largest bottle allowed by insurance Insurance Info:
Bin#004336 PCN#MEDDADV ID#X~6285~8616H0562CA~AE07101CA090~R10

Correction of Invalid Refills

After an eScript refill response was processed, on specific occasions, the approved refill number was not reset resulting in that refill being displayed for the subsequent prescription. This has been resolved.

Exact Expiration Date

You can now set a drug expiration date to an exact date that never changes until you change it. Simply go into the drug information window and set the "Days to expire" to a number 1. When set to 1, a date field will become visible to set.

Days Expire
Opioid Product Preferred

Copay Override

While in the Adjudication window, you can now click on the Copay filed on the right side and adjust the copay due to the patient. This copay will be saved to the prescription when closing the adjudication window.

Preferred Item Alerts

It was discovered that the alert displaying the question to "Change to the "Preferred Drug item" was not always displaying on refills. This has been corrected. If using the preferred option in the drug, you will begin to see more of these messages. Additionally, the message alerting you of a "more current NDC", optionally can be hidden. Please contact an RxBLU support rep if you want this hidden.

Compounding

Considerable changes have been applied to the multi-ingredient compounding module.

New Option in the FINISH field

When filling a new, refill, or edit, you can press a letter “V” to void a prescription.

Un-verify changes

When in checking mode, prior versions allow you to verify an already verified prescription. To un-verify a prescription requires you to use the “Right-Click” option. This was done due to reports of pressing verify twice which would accidentally un-verify a prescription.

Verifying a Partial Fill

When a prescription has already been verified and has a balance due, the program will display the following message:

This Rx has a balance due to the patient. Verify as fully filled? (Y/N)

If you are using RxBLU POS, then the balance due is not cleared. But a prescription audit entry is added recording the Rx as verifying the balance due. If you are NOT using RxBLUPOS, then the balance due amount is cleared and considered fulfilled.

Setting the Compliance/AutoFill Setting from the Profile

You can now check more than one prescription to be set for compliance. You must now check the small box before using the CPC profile button.

Enhanced Drug Selection

When filling any prescription, including new, refill, and edits, after the drug has been selected, if you press the equals sign “=” or press the EQU shown to the right will display all equivalent drugs in your drug file to the existing drug, including the brand name. This will streamline the process to change to a different equivalent.

IVR – Refill Too Soon

When a patient calls into the IVR and request a prescription to be refill that is in the “Refill Too Soon” queue, a message will be shared with the patient that the prescription is already scheduled to be refill. The request is NOT added to the IVR refill queue but is handled in the refill too soon queue.

RPH as MD

The “RPH” has been added to the degree selection menu in the prescriber details window.

Controlled Substance Serial Numbers

The serial number bar code can now be scanned when prompted for this number. For California, this number is now required as of January 1, 2021. While we allow you to complete the prescription, a warning is displayed and audited if the number is skipped.

Document Scan Reminder

If the origin is anything but an eScript for a new prescription, the program can remind you to scan the document. If you answer YES to the reminder, the scanner will begin the scan process.

Quantity Written for Electronic Prescriptions

When processing an eScript, if the Qty is changed (eg, 90 to 30), the written quantity remains at the original quantity from the prescriber. Prior versions set the written quantity to match the dispensed quantity.

Flu Vaccine Billing Assistance

Additional settings related to the drug being selected during the process will automatically set the appropriate DUR settings (PH,MA,3N) along with a set administration incentive fee added to the gross amount due. For this setting to take place, the incentive fee field needs to be set on all plans. If you administer the vaccines, contact an RxBLU support staff to have this turned on. Select the vaccine drug and go into the details of the drug. In the "DID" field, begin with FEE: followed by the amount to be sent in the claim. (eg, FEE:20.00).

Package Description	box, 10 pre-filled syringe, 0.5 ml Influenza Trivalent Virus		
Abbrev	<input type="text"/>	DID	FEE:30.00
NDC	70461001903	UPC	<input type="text"/>

Reports Enhancements

New Refillable Report

A new report has been created to report prescriptions that are due to be refilled. A text message can be sent to patients enrolled for texting that there are prescriptions available to be refilled. Please see report under "Prescriptions" menu, "Refillable Rx's". A phase 2 will enable the IVR to call the patient. Future Bi-directional texting will give the patient the opportunity to respond via text to refill the prescription.

Patient Profile Report Changes

Options to include voided prescriptions and to include prescriber details have been added.

Report Inventory Changes

The report can show only negative inventory values and only generics

End of Day

The summary report now breaks down new and refill counts.

POS Enhancements

Biometrics Compatibility

Use of finger scanning to log into each register.

HIPAA Alerts

When the patient is signing for a HIPAA consent, in addition to phrases displayed to the patient, an alert to the clear is visible.

	Unit Price	Total Price	SalesTaxAmt
	\$16.89	\$16.89	\$0.00
	\$0.67	\$0.67	\$0.00
